The attachfile package*

Scott Pakin scott+af@pakin.org

September 18, 2016

Abstract

This package defines an **\attachfile** command that lets you attach arbitrary files to a PDF document. These files are embedded right in the PDF file, so they get transmitted along with it. The package also gives you control over the corresponding icon's properties and various other associated metadata.

1 Introduction

PDF, Adobe's Portable Document Format, is a common way to distribute documents that look the same on all platforms and output devices. Beginning with PDF version 1.3, PDF supports "file attachment annotations". These are arbitrary auxiliary files that get embedded directly into the PDF document, just like attachments in an e-mail message.

The attachfile package gives $pdf I T_E X$ users the ability to add these attachments to their documents automatically. And because $I T_E X$ is a markup language, not a WYSIWYG tool, the user has precise control over the location of the file attachment icons. If an icon representing an attached spreadsheet file is placed next to a figure, the icon will move along with the figure whenever the document is modified. Furthermore, it is possible to define global properties for all the file attachments in a document. With one command, a user can change the properties of all the icons in the entire document.

Finally, one nifty feature that attachfile supports is the ability to use your own icons, which can be text, graphics, tables, mathematics—you name it! With this feature, a PDF file can, for example, instruct the reader to click on a formula to extract the Mathematica notebook that derived it. Or to click on a graph to extract the Microsoft Excel spreadsheet that contains all the data that was plotted. The possibilities are endless.

Okay, let's get down to business. Here are some sample file attachments so you can see if your PDF viewer is able to handle them:

^{*}This file has version number v1.9, last revised 2016/09/18.

Each of the above points to the $BiBT_EX$ bibliography (a plain text file) for the document you're reading now. Try extracting the attachment. In Adobe Acrobat, this is achieved by right-clicking on the icon and choosing "Save Embedded File to Disk..." (or in older versions of Adobe Acrobat, "Extract File..."). You can also double-click to open the file immediately. If you're unable to access the attached file, or you observe miscellaneous strange behavior, your PDF viewer might not be cabable of handling file attachments properly. See Section 5 for some PDF viewer problems I encountered while testing attachfile.

2 Usage

Load attachfile by putting a \usepackage{attachfile} in your document's preamble. attachfile implicitly loads a variety of other packages. Section 5 presents the complete list.

attachfile v1.9 does not have any of its own package options; any options that get passed to attachfile are forwarded to hyperref. Because hyperref works best when loaded as one of the last packages in the document the same holds true for attachfile.

3 Commands

The following are the commands that **attachfile** makes available for attaching files, customizing the icon appearance, and changing various file attachment metadata.

$[\langle options \rangle] \{\langle filename \rangle\}$

The **\attachfile** macro has only one required argument: the name of the file to attach. **\attachfile** will insert an icon at the current point in the document to represent the attachment. $\langle options \rangle$ is a list of optional parameters for describing the icon and other assorted metadata. It is described in Section 4.

$\ \ \left[\langle options \rangle \right]$

When writing instructions, it is sometimes convenient to describe what a file attachment icon looks like without actually attaching a file. That's what \noattachfile is for. All it does is insert the image of a file attachment icon into the document. $\langle options \rangle$ is a list of optional parameters for describing the icon and other assorted metadata. It is described in Section 4. In particular, note that if the print option is set to false then \noattachfile will output empty space of the same size as the icon image.

$\mathsf{textattachfile} [\langle options \rangle] \{\langle filename \rangle\} \{\langle text \rangle\}$

\textattachfile is just like **\attachfile**, except that instead of using one of the predefined PDF icons, it lets you use an arbitrary piece of text to represent the attachment. The $\langle text \rangle$ parameter is not limited to text; it can contain any arbitrary horizontal material. The following are all legal uses of **\textattachfile**:

- You can \textattachfile{myfile.cc}{extract my source code} if your PDF viewer supports file annotations.
- It is intuitively obvious to even the most casual observer that

```
\textattachfile{derivation.m}{$\displaystyle
   \frac{\partial E_p}{\partial w_{ji}^h} =
    -\sum_k (y_{pk} - o_{pk}) f_k^{o}{}'(\mbox{net}_{pk}^o)
        w_{kj}^o f_j^h{}'(\mbox{net}_{pj}^h) x_{pi}$}
```

• \textattachfile{earningsdata.csv}{\includegraphics{earnings}}

$\time [\langle options \rangle] \{\langle text \rangle\}$

Just as **\noattachfile** is a dummy version of **\attachfile**, so **\notextattachfile** is a dummy version of **\textattachfile**. All **\notextattachfile** does is insert $\langle text \rangle$ into the document according to $\langle options \rangle$ (described in Section 4). In particular, note that if the print option is set to false then **\notextattachfile** will output empty space of the same size as $\langle text \rangle$.

$\mathbf{tetachfilesetup} \{ options \}$

If you find yourself passing the same set of options to multiple **\attachfile** calls in your document, you can use **\attachfilesetup** to specify default option values. **\attachfilesetup**'s *(options)* parameter is the same as that used by **\attachfile** and is described in Section 4. Some noteworthy points are:

- 1. \attachfilesetup can be called as many times as desired. Any options specified replace the previous value of those options. All unspecified options are left alone.
- 2. Options passed to **\attachfile** take precedence over those specified by **\attachfilesetup**. This lets you define default values for all file attachments and selectively override them on a per-attachment basis.
- 3. Options set by **\attachfilesetup** are local to the current scope. This lets you assign defaults to a group of file attachments without affecting the global defaults. To define options that apply to the entire document, **\attachfilesetup** should be called at the top-level scope (which includes the document's prologue).

4 Options

attachfile gives the user a great deal of control over the way files are attached to a document. All the commands in Section 3 accept the same set of options, which are entered as comma-separated, $\langle key \rangle = \langle value \rangle$ pairs. Options can be specified in any order. Case is significant. Only the options you want to change need to be specified; the others will retain their previous value (or the default, if no previous value was specified).

4.1 List of available options

The following are the options attachfile accepts, in alphabetical order.

 $appearance=\langle boolean \rangle$

The attachfile package normally embeds the file attachment's icon explicitly with each file attachment annotation. (In PDF-speak, it includes an appearance dictionary in the FileAttachment object.) The advantages to doing this are to ensure that:

- The file attachment icons look the same in all PDF viewers.
- $\bullet~T_{\rm E}\!X$ knows exactly how much space to allocate, instead of just guessing based on the size of the Adobe Acrobat icons.
- Pre-1.3 PDF viewers don't regress to showing an "unknown annotation type" graphic.

However, the problems with embedding the icon graphic are:

- It adds a bit of extra bulk to the PDF file.
- It takes flexibility away from the PDF viewer, which can no longer choose for itself how best to render a file attachment icon.

The appearance option gives the author the ability to prevent the icon's appearance from being specified explicitly in the PDF file. By setting appearance=false, it will be left up to the PDF viewer to decide how to display the icon.

$author=\langle text \rangle$

The metadata associated with a file attachment annotation includes the name of the person who attached the file. In Adobe Acrobat, this information is shown when one right-clicks on the file attachment icon and selects *Properties...* By default, no author is listed but specifying $author=\langle name \rangle$ sets the author field to $\langle name \rangle$.

$color=\langle red \rangle \langle green \rangle \langle blue \rangle$

The icons inserted by **\attachfile** and the text inserted by **\textattachfile** can be any color. The color option sets this color. Each of $\langle red \rangle$, $\langle green \rangle$, and $\langle blue \rangle$ must be a decimal number between 0 (darkest) and 1 (brightest). The default is color=1 0.9255 0.7765, which is a beige.

$created = \langle PDF \ date \rangle$

Virtually all filesystems associate a file-creation timestamp with each file. Although T_EX provides no portable mechanism for determining the date and time a file was created the **created** option lets you manually specify these parameters for the reader's benefit. See Section 4.2 for more information about **attachfile** dates.

$date=\langle PDF \ date \rangle$

Each annotation in a PDF file can have a timestamp indicating when the annotation was last modified. attachfile automatically adds a timestamp to file attachment annotations. It uses the date and time at which LATEX started processing your job (to minute precision because that's what TEX's \time command provides) and includes the timezone, if specified (using the timezone option, p. 7). Although it's unlikely you'll need to use it, the date option lets you override the annotation's modification date and time with a date and time of your choice. See Section 4.2 for more information about attachfile dates.

description= $\langle text \rangle$

The metadata associated with a file attachment annotation can include a brief description of the file. In Adobe Acrobat, this information is shown when one right-clicks on the file attachment icon and selects *Properties...* Also, in later versions of Adobe Acrobat, the description field shows up as a tool tip when the user mouses over the attachment. By default, no description is included, but specifying description= $\langle text \rangle$ sets the description field to $\langle text \rangle$.

$icon=\langle name \rangle$

PDF 1.3 defines four icons that can be used for file attachments: Graph, Paperclip, PushPin, and Tag. These are shown in Table 1. If no icon name is specified, PushPin is assumed. While the PDF specifications say that, normally, a PDF viewer chooses how to display each of those, the attachfile package specifies the appearance explicitly. This is what Adobe Acrobat does, presumably because doing so ensures that viewers which don't support file attachment annotations can still display something reasonable. The tradeoff is that it slightly increases the size of the PDF file.

Table 1: Valid file attachment icons

mimetype= $\langle type \rangle$

It is considered good practice to specify the MIME type [2] of each attached file. That way, a PDF viewer can automatically launch an appropriate application to process the file. $\langle type \rangle$ should be the form " $\langle type \rangle / \langle subtype \rangle$ ". For instance, a plain text file would be specified with "mimetype=text/plain". An MPEG movie would be specified with "mimetype=video/mpeg". The Internet Assigned Numbers Authority maintains a list of registered media types [3], so look there first to see what type to use for a given file.

modified= $\langle PDF \ date \rangle$

Virtually all filesystems associate a last-modification timestamp with each file. Although T_{EX} provides no portable mechanism for determining the date and time a file was last modified the modified option lets you manually specify these parameters for the reader's benefit. See Section 4.2 for more information about attachfile dates.

$print=\langle boolean \rangle$

By default, file annotation icons print along with the rest of the document. By setting print=false, the icons will not print. Note that in Adobe Acrobat, annotations will *never* print unless the Annotations box is checked in the Print dialog.

$size=\langle integer \rangle$

The **size** option tells the PDF viewer that the attached file is $\langle integer \rangle$ bytes long. Adobe Acrobat displays this size under the "Size" column in the Attachments pane but does not otherwise seem to use the $\langle integer \rangle$ value.

$\texttt{subject} = \langle \textit{text} \rangle$

The metadata associated with a file attachment annotation can include a brief comment about the subject of the attachment. In Adobe Acrobat, this information is shown when one right-clicks on the file attachment icon and selects *Properties*. By default, no subject is included, but specifying $subject=\langle text \rangle$ sets the subject field to $\langle text \rangle$.

$timezone=\langle offset \rangle$

Because T_{EX} doesn't make the current timezone available, attachfile is unable to include timezone information when it timestamps a file attachment. The timezone option lets you manually specify the timezone. $\langle offset \rangle$ is the offset from Universal Time (a.k.a. GMT) and should be in the format specified in the PDF reference manual [1, §3.8.3, "Dates"], namely:

+ $\langle HH \rangle$ ' $\langle mm \rangle$ '	$\langle HH\rangle$ hours, $\langle mm\rangle$ minutes later than Universal Time (i.e., east of Greenwich, England)
$-\langle HH \rangle$ ' $\langle mm \rangle$ '	$\langle HH\rangle$ hours, $\langle mm\rangle$ minutes earlier than Universal Time (i.e., west of Greenwich, England)
_	

Z Universal Time (i.e., at the same longitude as Greenwich, England)

For example, U.S. Central Time would be specified with timezone=-06'00'.

$\mathtt{zoom} = \langle boolean \rangle$

Normally, when a reader magnifies or reduces the view of the PDF document, the file annotation icons change size proportionally with the text. By setting zoom=false, the icon size does not scale.

The defaults for all of the options described above are summarized in Table 2.

4.2 Date usage

Section 4.1 presents three timestamp-related options: date, created, and modified. The date option specifies the annotation date—the date and time the given file was attached to the PDF file—and should usually be left unspecified. (It defaults to the date and time at which IATEX started processing your job.) The annotation date is displayed in Adobe Acrobat by right-clicking on the annotation, choosing *Properties...* from the menu, and clicking on the *General* tab. The modified option specifies the file's modification date—the date and time the given file was last modified. Adobe Acrobat displays the modification date under the "Modified" column in the Attachments pane but does not otherwise appear to

Option	Default setting
appearance	true
author	none
color	1 0.9255 0.7765
created	none
date	automatic
description	none
icon	PushPin
mimetype	none
modified	none
print	true
size	none
subject	none
timezone	none
zoom	true

Table 2: Default values for all options

use the modification date. Finally, the **created** option specifies the file's creation date—the date and time the given file was first written to disk. As of this writing, Adobe Acrobat does not appear to use or even display the creation date; perhaps future versions or other PDF viewers will.

Dates should be specified in the form "D: YYYYMMDDHHmmSSOHH, mm," as described in the PDF reference manual [1, §3.8.3, "Dates"]. Note, however, that although the PDF reference manual clearly states that "viewer applications should be prepared to accept and display a string in any format" [1, Table 8.11, "Entries common to all annotation dictionaries"], Adobe Acrobat will ignore any timestamp that is not in the recommended format and will instead show "00/00/00 00:00:00" for the annotation date or "Unknown" for the modification date.

5 Caveats

Note that there are a few caveats you should be aware of:

- 1. attachfile requires either pdfl&TEX version 0.14 or later or LuaL&TEX. (Version 0.14 of pdfl&TEX was released circa 1999 so it's unlikely that you're running an older version than that.) While there are many other ways to produce PDF files from LATEX source, attachfile v1.9 supports only pdflATEX and LuaLATEX.
- 2. LuaIATEX 0.85 introduced incompatible changes in the set of PDF primitives supported. Because attachfile does not yet provide explicit support for these new primitives, documents will need to include a \usepackage{luatex85} line in the preamble in order to build under LuaIATEX 0.85+.

- 3. attachfile will not run unless the following IATEX packages are installed: calc, keyval, color, hyperref, and ifpdf. (Most T_EX distributions include all of these.)
- 4. File attachments are a PDF 1.3 feature. They will not be visible in PDF viewers that don't support PDF 1.3. (Version 4.0 of Adobe Acrobat is the first version of that program which does.)
- 5. Even some viewers that purportedly support PDF 1.3 don't support file attachments. As far as I can tell, very old versions of Adobe Acrobat Reader (the free, view-only version of Adobe Acrobat) doesn't seem to support *any* annotations except text annotations.
- 6. Even some viewers that do support PDF 1.3 and file attachments don't support them under all circumstances. For instance, some Windows versions of Adobe Acrobat, when functioning as a Web-browser plug-in, give an error message¹ when a file attachment icon is activated.
- 7. Even in circumstances where file attachments are supported, the support may be flawed. For example, some Windows versions of Adobe Acrobat change a custom icon to the default icon when it's selected.
- 8. While file-attachment icons with custom appearances printed fine in older versions of Adobe Acrobat, Adobe introduced a bug circa Adobe Acrobat 6.0 that prevents attachfile's icons from printing. Unfortunately, because Adobe Acrobat lacks attachfile's ability to create custom appearances for file-attachment icons it's unlikely that this bug will ever get fixed. Nevertheless, please consider sending a bug report to Adobe to let them know that you'd like to be able to print file-attachment icons with custom appearances.

Even given all of those caveats, file attachments can be a useful way to pass additional information along with a PDF file. The **attachfile** package makes file annotations automatic and easy.

6 Implementation

This section contains the complete source code for attachfile. Most users will not get much out of it, but it should be of use to those who need more precise documentation and those who want to extend the attachfile package.

6.1 Sanity checking

attachfile v1.9 requires either LualATEX or pdflATEX (and at least version 0.14 of pdflATEX, although attachfile no longer checks for that). (Future versions of attachfile may support dvipdfm, dvips with pdfmarks, VTEX, etc.) Also, pdflATEX/LualATEXmust be in PDF-generating mode, not DVI-generating mode. So, to save

 $^{^1}$ "Launching embedded files from within a browser environment is not allowed".

the user some aggravation, we check for the correct backend right up front and give a warning if all is not well. Later, in Section 6.7, we replace all of the core attachfile macros with dummy versions so LAT_FX can at least run to completion.

```
1 \RequirePackage{ifpdf}
2 \ifpdf
3 \else
4 \PackageWarningNoLine{attachfile}{%
5 attachfile works _only_ with pdfLaTeX and LuaLaTeX\MessageBreak
6 and _only_ in PDF-generating mode. For this run,\MessageBreak
7 placeholders will be substituted for all\MessageBreak
8 attachfile commands%
9 }
10 \fi
```

6.2 Preliminaries

We need to load hyperref to get our hands on that great \pdfstringdef macro. For now, we blindly pass all our package options directly to hyperref. In the future, it would be nice to do a \setkeys{AtFi} on our options.

```
11 \RequirePackage{keyval}
12 \RequirePackage{calc}
13 \RequirePackage{color}
14 \RequirePackageWithOptions{hyperref}
```

6.3 Adobe Acrobat icons

The following macros draw a representation of the various icons that Adobe Acrobat² inserts to represent what the PDF 1.3 specifications refer to as "Graph," "Paperclip," "PushPin," and "Tag". The \parbox dimensions are taken directly from the original graphics' bounding box. However, I just eyeballed the \raisebox heights (intended to put shadows below the baseline).

                                              116 \newsavebox{\atfi@appearancebox}
                                               \atfi@set@appearance stores its argument as a PDF XObject for later referral by
   \atfi@set@appearance
   \atfi@appearance@obj
                                               the file annotation's appearance dictionary. This serves two purposes:
                                                     1. It enables a T_{EX} box with arbitrary contents to serve as the file attachment
                                                          icon.
                                                     2. It enables (generally older) PDF viewers that don't recognize the icon name
                                                          to still display something meaningful.

\atfi@insert@file@annot Insert a PDF FileAttachment annotation that refers to the object created by \atfi@embedfile. T_EX doesn't normally "see" a \pdfannot, so we have to explicitly allocate space for it. \atfi@insert@file@annot takes one argument, the name of the file to attach. This should be the same value that was passed to \atfi@embedfile.

```
136 \DeclareRobustCommand{\atfi@insert@file@annot}[1]{%
137 \rule{0pt}{0pt}%
138 \bgroup\Hy@unicodefalse
139 \atfi@pdfstringdef\atfi@file{#1}%

\atfi@attachfile This macro does all the work of the \attachfile author command. \attachfile
 began a group in which most special characters are set to category code "other".
 \atfi@attachfile reads the filename within this group, embeds the correspond ing file into the generated PDF file, and places an icon at the current location.
 Then, it ends the group, thereby restoring the original category codes.

```
183 \def\atfi@attachfile#1#2{%

\atfi@textattachfile@i \atfi@textcolor This macro does all the work of the \textattachfile author command. Given a filename, some arbitrary text, and an optional set of attachment options, embed the corresponding file into the generated PDF file, and use the text as the icon. We recycle the icon color for the text. Note that the \strut is a bug workaround; I don't know whose fault this is, but the bottom point or so of the text seems to get cut off. Weird.

```

```

\atfi@pdf@slash The PDF specification dictates that MIME types be specified not as strings (e.g., "(Hello)") but rather as PDF names (e.g., "/Hello"). The catch is that the forward slash—required in all MIME types—cannot be part of a PDF name. The solution is to replace the MIME "/" with the hexadecimal sequence "#2f". Unfortunately, pdfIAT_EX replaces "#" with "##" in a \pdfobj but leaves "\#" as is. The solution is to play some games with T_EX to define \atfi@pdf@slash as a "#2f" sequence that can used within \pdfobj.

```
213 \bgroup

\atfi@split@mime@type Split a MIME type (e.g., "image/jpeg") into a type, \atfi@mime@type (e.g., "image"),
and a subtype, \atfi@mime@subtype (e.g., "jpeg").
\atfi@mime@subtype 217 \def\atfi@split@mimetype#1/#2/{%
218 \def\atfi@mime@type{#1}%
219 \def\atfi@mime@subtype{#2}%
```

```
220 }
```

6.5 Annotation option processing

We start by defining the various options that **\attachfile** accepts and their default values.

\atfi@mimetype Declare the MIME type of the attached file. For example, "text/plain" would specify that the attachment is an ordinary text file.

```
221 \def\atfi@mimetype{}
222 \define@key{AtFi}{mimetype}{%
223 \atfi@pdfstringdef\atfi@mimetype{#1}%
224 \atfi@split@mimetype#1/%
225 \edef\atfi@mimetype{%
226 /Subtype /\atfi@mime@type\atfi@pdf@slash\atfi@mime@subtype
227 }%
228 }
```

\atfi@icon Specify an icon to represent the attachment. This should be one of Graph, Pa-\atfi@icon@icon perclip, PushPin (the default), or Tag. \atfi@icon is an attribute/value pair that gets inserted directly into the file attachment object. \atfi@icon@icon is only the icon name itself and is used to insert a static graphic that represents Adobe Acrobat's rendition of a file attachment icon.

```
229 \define@key{AtFi}{icon}{%
230 \def\atfi@icon{/Name /#1}%
231 \def\atfi@icon@icon{#1}%
232 }
233 \setkeys{AtFi}{icon=PushPin}
```

\atfi@color Specify the color of the attachment icon as an RGB triplet. For example, "0 0.3 \atfi@color@rgb 0" would be a fairly dark green. \atfi@color is an attribute/value pair that gets inserted directly into the file attachment object. It defaults to the empty string, which means the PDF viewer gets to choose what color the icon should be. \atfi@color@rgb is only the RGB triplet itself and is used to insert a static graphic that represents Adobe Acrobat's rendition of a file attachment icon. It defaults to a beige color.

```
234 \define@key{AtFi}{color}{%
235 \def\atfi@color{/C [#1]}%
236 \def\atfi@color@rgb{#1}%
237 }
238 \setkeys{AtFi}{color=1 0.9255 0.7765}
```

\atfi@author Specify the author of the annotation. Adobe Acrobat shows this when you rightclick on the annotation and choose *Properties*.

```
239 \def\atfi@author{}
240 \define@key{AtFi}{author}[]{%
241 \edef\atfi@author{/T (#1)}%
242 }
```

\atfi@pad@ii Pad a number to exactly two digits. This is used by \atfi@date (below).

243 \def\atfi@pad@ii#1{% 244 \ifnum#1>9 245 #1% 246 \else 247 0#1% 248 \fi 249 }

```
\atfi@timezone
                   Specify the timezone to attach to the file modification date. It would be awfully
                    nice if T<sub>F</sub>X had some way to produce this automatically. (Does it?)
                   250 \def\atfi@timezone{}
                   251 \define@key{AtFi}{timezone}{\def\atfi@timezone{#1}}
                   The date the annotation was last modified. It's unlikely you'd want to specify
       \atfi@time
                   this explicitly in your LATEX document, but if you want to, you can. Seconds are
      \atfi@hours
    \atfi@minutes
                   hardwired to zero, and the time zone must be manually specified. (I don't believe
                   TEX makes either of those available.) Note that \time is stored in \atfiCtime
       \atfi@date
                    in case the minutes roll over during the time calculations. I was too lazy to do
                    the same for \day, \month, and \year, so don't process your LATEX document at
                    midnight if you want to get a correct datestamp.
                   252 \edef\atfi@time{\time}
                   253 \setcounter{atfi@tmp}{\atfi@time/60}
                   254 \edef\atfi@hours{\theatfi@tmp}
                   255 \setcounter{atfi@tmp}{\atfi@time-\atfi@hours*60}
                   256 \edef\atfi@minutes{\theatfi@tmp}
                   257 \def\atfi@date{%
                        /M (D:\the\year%
                   258
                            \expandafter\atfi@pad@ii\the\month
                   259
                            \expandafter\atfi@pad@ii\the\day
                   260
                   261
                            \atfi@pad@ii\atfi@hours
                   262
                            \atfi@pad@ii\atfi@minutes
                            00%
                   263
                            \atfi@timezone)%
                   264
                   265 }
                   266 \define@key{AtFi}{date}{%

              297
              298 }
               Store the annotation's file size. Adobe Acrobat shows this when you right-click
   \atfi@size
 \atfi@dlsize on the annotation and choose Properties. It also shows it in the Annotations tab
               once you "Rescan Document". Note that file size is a PDF 1.5 feature.
               299 \def\atfi@size{}
              300 \def\atfi@dlsize{}
              301 \define@key{AtFi}{size}{%
                    \bgroup \Hy@unicodefalse
              302
                      \atfi@pdfstringdef\atfi@size{#1}%
              303
              304
                      \edef\next{\egroup
              305
                        \def\noexpand\atfi@size{/Size \atfi@size}%
                        \def\noexpand\atfi@dlsize{/DL \atfi@size}%
              306
              307
                      }\next
```

```
308 }
```

```
\ifatfi@print By default, file annotation icons print along with the rest of the document. (In \atfi@printtrue Adobe Acrobat, that's the case if and only if the Annotations box is checked in \atfi@printfalse the Print dialog.) By setting print=false, the icons will not print.
```

```
309 \newif\ifatfi@print
310 \atfi@printtrue
311 \define@key{AtFi}{print}[true]{\csname atfi@print#1\endcsname}
```

\ifatfi@zoomtrue By default, file annotation icons zoom along with the rest of the document. By \atfi@zoomtrue setting zoom=false, the icons will remain at a constant size, regardless of magni-\atfi@zoomfalse fication.

```
312 \newif\ifatfi@zoom
313 \atfi@zoomtrue
314 \define@key{AtFi}{zoom}[true]{\csname atfi@zoom#1\endcsname}
```

\ifatfi@appearance Th \atfi@appearancetrue and \atfi@appearancefalse and \atfi@appearance@dict nee

The attachfile package normally embeds an icon graphic in each file attachment annotation's appearance dictionary. By setting appearance=false, no appearance dictionary will be added to a file attachment annotation; the PDF viewer will need to decide for itself how to display the icon.

```
315 \newif\ifatfi@appearance
316 \atfi@appearancetrue
317 \def\atfi@appearance@dict{}
318 \define@key{AtFi}{appearance}[true]{\csname atfi@appearance#1\endcsname}
```

6.6 Author commands

The commands described in this section are those available to the user writing a IAT_EX document. If the macros seem too simple, it's because all the work is performed by the helper routines in Section 6.4 and the option-processing routines in Section 6.5.

\attachfilesetup Set default values for all the various annotation options.

319 \DeclareRobustCommand{\attachfilesetup}[1]{\setkeys{AtFi}{#1}}

\attachfile Given a filename and an optional set of attachment options, embed the corresponding file into the generated PDF file, and place an icon at the current location. The real work is performed by \atfi@attachfile. \attachfile merely sets up the category codes in such a way as to allow filenames to contain special characters such as underscores.

320 \DeclareRobustCommand{\attachfile}[1][]{%

- 321 \begingroup
- 322 \let\do\@makeother
- 323 \dospecials
- 324 \catcode'\\=0\relax
- 325 \catcode'\{=1\relax
- 326 \catcode'\}=2\relax
- 327 \atfi@attachfile{#1}%

```
328 }
```

\textattachfile Given a filename, some arbitrary text, and an optional set of attachment options, embed the corresponding file into the generated PDF file, and use the text as the icon. After setting up the category codes to use for processing the filename, \textattachfile passes to control to \atfi@textattachfile, which resets the category codes, and then to \atfi@textattachfile@i, which does all the work. We define two groups: one for keeping the attachment options local and one for temporarily altering category codes.

329 \DeclareRobustCommand{\textattachfile}[1][]{%

```
330
     \begingroup
331
       \begingroup
332
         letdo@makeother
333
         \dospecials
334
         \catcode'\\=0\relax
335
         \catcode'\{=1\relax
336
         \catcode'\}=2\relax
337
         \atfi@textattachfile{#1}%
338 }
```

\noattachfile Insert the same icon into the document that we would for an \attachfile call. This is useful for writing documentation that instructs a user on how to deal with file attachments. \noattachfile is fairly simple; is just calls \setkeys in order to get the latest values of \atfi@icon@icon and \atfi@color@rgb, and then it defers to one of \atfi@acroGraph, \atfi@acroPaperclip, \atfi@acroPushPin, or \atfi@acroTag, which do the actual rendering work.

```
339 \DeclareRobustCommand{\noattachfile}[1][]{%
     \begingroup
340
        \setkeys{AtFi}{#1}%
341
        \ifatfi@print
342
         \csname atfi@acro\atfi@icon@icon\endcsname
343
344
        \else
          \setbox0=\hbox{\csname atfi@acro\atfi@icon@icon\endcsname}%
345
          \makebox[\wd0]{}%
346
       \fi
347
     \endgroup
348
349 }
```

\notextattachfile Insert the same text into the document that we would for a \textattachfile call. This is useful for writing documentation that instructs a user on how to deal with file attachments.

```
350 \DeclareRobustCommand{\notextattachfile}[2][]{%
     \begingroup
351
       \setkeys{AtFi}{#1}%
352
       \ifatfi@print
353
         \def\atfi@textcolor(##1 ##2 ##3)##4{%
354
           \textcolor[rgb]{##1,##2,##3}{##4}}%
355
356
         \expandafter\atfi@textcolor\expandafter
           (\atfi@color@rgb){#2\strut}%
357
358
       \else
          \setbox0=\hbox{#2\strut}%
359
         \mbox[\wd0]{}%
360
       \fi
361
362
     \endgroup
363 }
```

6.7 Dummy commands

If the author is not using pdflaTEX or LualaTEX or not using it in PDF-generating mode, we replace the core attachfile commands with dummy versions so IaTEX can at least run to completion.

364 \ifpdf 365 \else

\atfi@dummy@pushpin Define an empty space of approximately the same size as \atfi@acroPushPin.

```
366 \def\atfi@dummy@pushpin{%
367 \raisebox{-1.25bp}{\parbox[b][14bp]{24bp}{}%
368 }
```

\textattachfile Define a dummy \textattachfile in terms of \notextattachfile.

```
369 \DeclareRobustCommand{\textattachfile}[3][]{%
370 \notextattachfile[#1]{#3}%
371 }
```

\noattachfile Define a dummy \noattachfile in terms of \notextattachfile.

```
372 \DeclareRobustCommand{\noattachfile}[1][]{%
373 \notextattachfile[#1]{\atfi@dummy@pushpin}%
374 }
```

\attachfile Define a dummy \attachfile in terms of the dummy \noattachfile.

```
375 \DeclareRobustCommand{\attachfile}[2][]{%
376 \noattachfile[#1]%
377 }
378 \fi
```

7 Future work

The following are some avenues for future work on attachfile. First, attachfile supports only pdfIATEX and LuaIATEX for generating PDF files. It would be nice if it supported all the backends that hyperref supports: dvipdfm, dvips with pdfmarks, VTEX, and so forth. Along those same lines, a "draft" package option would be a welcome addition, for use when PDF is not the final output format.

Second, PDF supports platform-specific file attachments. That is, a file attachment icon can represent a different file when activated on Windows, Unix, or MacOS. It might be nice for **attachfile** to support that feature.

Finally, I'd like to see attachfile expand sometime to support *all* the various PDF annotations: Sound, Movie, Stamp, Ink, Popup, etc.

Of course, I make no promises that I'll ever do *any* of the above. **attachfile** was just something I wrote in my spare time, and it's unlikely I'll be able to devote another large block of time to enhance it.
